

## OPTIMISING SHIPYARD PROCESSES

The need to reduce emissions and optimise processes is relevant also for **shipyards** where vessels are built and repaired.

At shipyards, inefficiencies are often most prominent in **process management** and **supply chain management**.

**Optimisation** of processes, **restructuring** of work, and **capitalisation** of new digital technologies can improve productivity and efficiency at shipyards.

Digital technologies, such as **3D scanning**, **VR** and **AR solutions**, can be utilised to improve block manufacturing, dry docking and repair operations.
