

# The Austrian Minerals Plan EU best practice – 7 years after R. Holnsteiner

- ▶ Mineral resources are the **basis for our industrial production and infrastructure development** and maintenance
- ▶ **Sufficient supply** with mineral resources is an indispensable fundament for functioning and successful economies
- ▶ EU is confronted with a number of challenges along the entire raw materials value chain to secure a **sustainable access** to non-energy non-agricultural raw materials
- ▶ EU raw materials industries provide ~ **280 billion € of added value**
- ▶ > **11 million jobs** in the EU depend on the availability of raw materials

- ▶ Although the **geological availability** of raw materials is currently regarded **unproblematic**, yet shortages due to political (trade and geopolitical) factors and social demands are recorded
- ▶ **finiteness** of mineral resources
- ▶ **site-dependency** of mineral extraction
- ▶ future trends indicate that **global resource use could double** between 2010 and 2030
- ▶ Raw materials supply is a **core competence of the industry**
- ▶ Public administration has to provide **appropriate framework conditions** for a sufficient and sustainable supply with minerals resources

## Austrian Minerals Strategy

### Pillar 1:

Securing minerals supply from domestic resources (Mining Act, Austrian Minerals Plan)

### Pillar 2:

Securing minerals supply from other countries (Raw Materials Partnerships)

### Pillar 3:

Promoting resources efficiency (substitution, recycling)

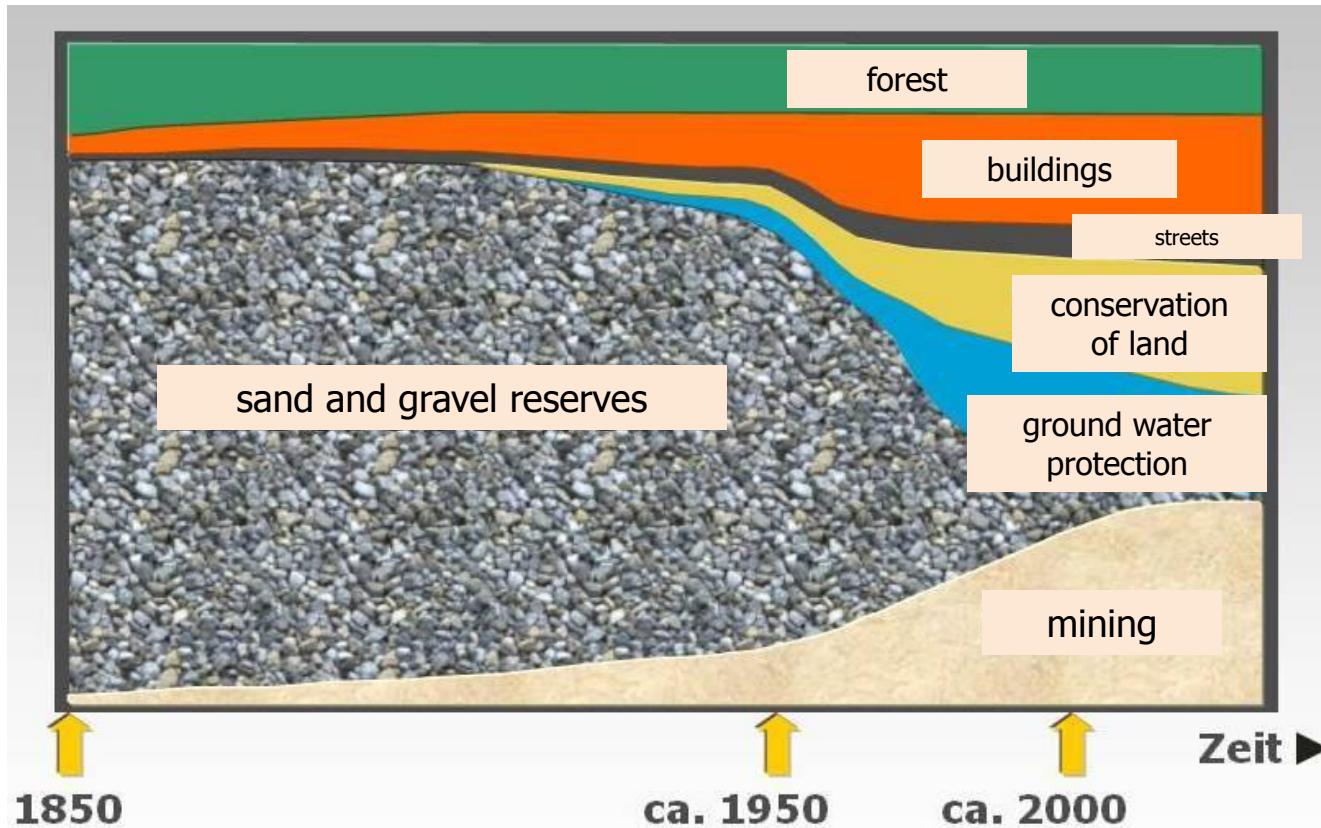

## Horizontal Measures

# Main problem = access to deposits

# Starting point

[www.bmwf.at](http://www.bmwf.at)

- ▶ Resolution of Parliament E 106-NR/XXL GP of 21st November 2001
- ▶ "Federal Minister of Economy and Labour is invited to work out an Austrian Minerals Plan, which documents the deposits of mineral resources required.... (in a reasonable time)
- ▶ On the basis of this documentation a plan covering the whole nation has should be elaborated, in relation to the specific demand of the countries and communities. This plan should be a future basis for extraction permits."

# Institutions on board

[www.bmwf.at](http://www.bmwf.at)

- ▶ Lead BMWFW (BMWA, BMWFJ)
- ▶ Fed. Ministry of Agriculture, Forestry, Environment and Water Management
- ▶ Provinces (land use managm. authorities, geol. experts, water managm. authorities)
- ▶ Geol. Survey
- ▶ Universities (Leoben, Wien)
- ▶ Research organisations (Academy of Science, BVÖ)
- ▶ Advocacy, Mining Associations (S&K, B&S)
- ▶ Chamber of Commerce, Labour Assoc.
- ▶ NGO`s (WWF)

## Phase 1:

### **baseline**

WG 1	Geology and resources	(GBA)
WG 2	Mining, Mineral Economics	(MUL)
WG 3	GIS implementation	(BMWFW)
WG 4	Security of supply	(BMWFW)

## Phase 2:

### **Adjustment of the results with the provinces**

# Evaluation scheme

[www.bmwf.at](http://www.bmwf.at)

Bundesministerium für  
Wissenschaft, Forschung und Wirtschaft

shallow deposits  
(aggregates)

- ▶ demand-oriented  
safeguarding process

deep deposits (ores,  
industrial minerals)

- ▶ supply-oriented  
safeguarding process

## aggregates:

- ▶ expansion of existing extraction sites instead of green field (as far as possible)
- ▶ exploitation of deposit as complete as possible (avoid ruthless exploitation; dredging)
- ▶ safeguard sites where an environmental friendly exploitation is possible (hauling shaft - tunnel systems in case of hard rocks)
- ▶ consumer-near extraction sites to enhance economical efficiency (SME based RM-business) and reduce transport emissions
- ▶ safeguard conflict free best quality resources first
- ▶ consider multifunctional land use

# Evaluation scheme - priorities

[www.bmwf.at](http://www.bmwf.at)

## **ores/industrial minerals:**

- ▶ operational facilities like processing plants should be situated underground as far as possible
- ▶ recommended for safeguarding: deposits with enough reserves which could be exploited economically
- ▶ conditionally recommended for safeguarding: deposits with enough reserves which could not be exploited economically currently (but with suitable development in commodity prices and/or technical developments)

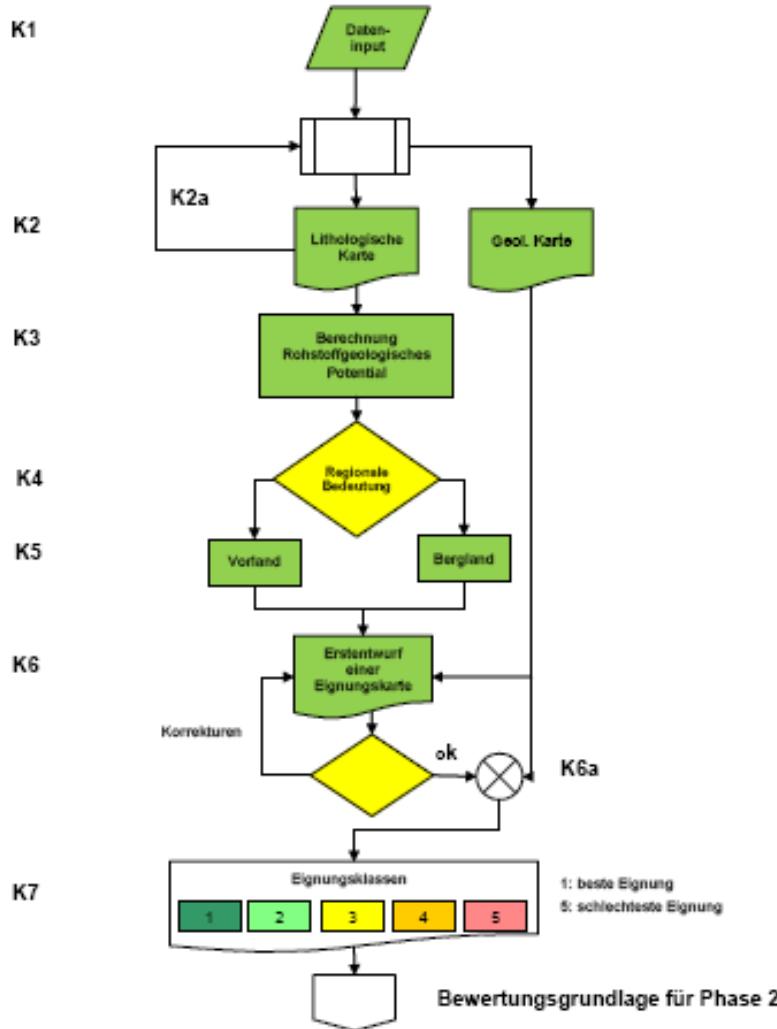

# Evaluation scheme unconsolidated rocks

Phase 1 - Ressourcenerhebung und Evaluierung:  
Kiessande

Bundesministerium für  
Wissenschaft, Forschung und Wirtschaft

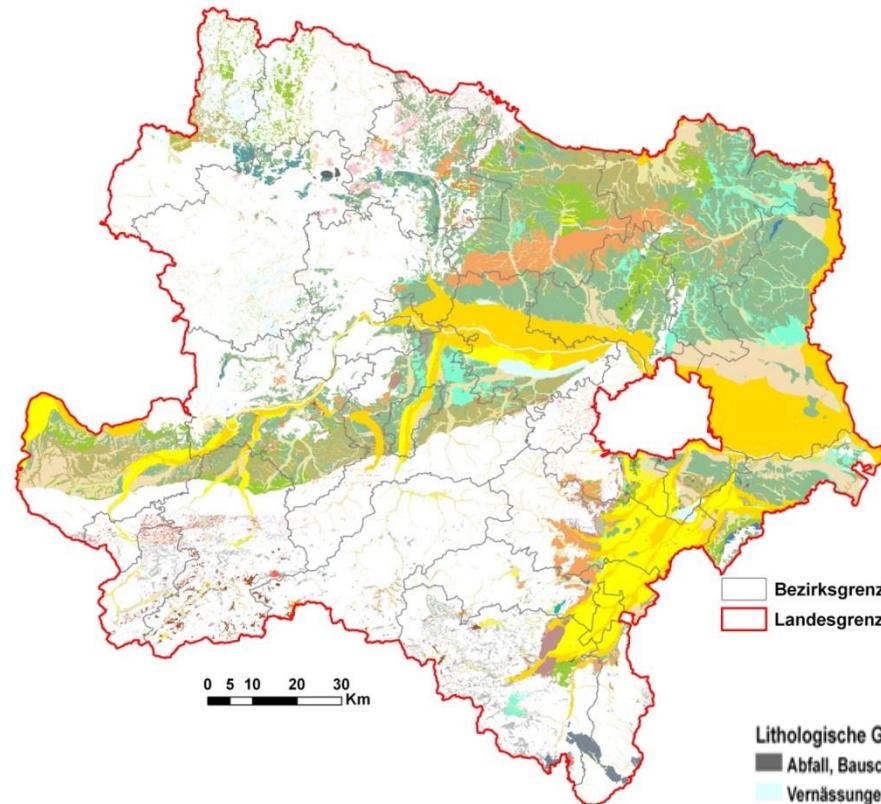

# Lithological map of unconsolidated rock

[www.bmwf.at](http://www.bmwf.at)

Bundesministerium für  
Wissenschaft, Forschung und Wirtschaft

## Lithologische Gliederung

- Abfall, Bauschutt, Gesteinsbruchstücke variabler Zusammensetzung, Bergbauhalden
- Vernässungen, Sümpfe, Moore
- Massenbewegungen undifferenziert, Gleitschollen, Rutsch- und Sackungsmassen
- vorw. Grobkorn und Sand, gut sortiert, regional verfestigte Lagen: letztkaltzeitliche Schotterterrassen
- Grobkorn, gerundet; z.T. Sand, meist gut sortiert; regional Feinkornbedeckung (Aulehme); jüngste Talfüllungen breiter Täler
- vorw. Grobkorn, variable Rundung und Sortierung; z.T. Sand; regional Feinkornbedeckung (Aulehme); jüngste Talfüllungen schmaler Täler
- vorw. Grobkorn, gerundet, meist sandig, meist sortiert, z.T. verfestigt: neogene Grobsedimente

# Assessment of quality

www.bmwf.at

Bundesministerium für  
Wissenschaft, Forschung und Wirtschaft

	Lithology	Use	Geol. representative
A	Well-washed gravels and sands without significant proportion of fines, loose	Concrete, Construction sand after sieving	Lower terraces, partly alluvial zones of large valleys
B	Gravels and sands partly with higher fines content, loose, partly consolidated/cem. gravels and sands	Concrete, Construction sand after sieving and ev. crushing	Lower terraces, high-terraces, alluvial zones of smaller side valleys, alluvial fans
C	Gravels and sands with high fines content, usually loose	Embankments, concrete after complex processing	High-terraces (brittle grains, friable agglom., Fe-content), interbedded with tertiary strata
D	Gravels and sands with high fines and blocks content	Embankments	Blocky gravel, blocky debris
E	Diamikton (mixture of clay, silt, sand, gravel and blocks)	Partly for embankments after processing, improper for use with high fines content	colluvium, solifluction layer

# Assessment of quantity

[www.bmwf.at](http://www.bmwf.at)

	Area (A)	Thickness (M)
AMM	> 1 km <sup>2</sup>	> 10m
AM	> 1 km <sup>2</sup>	> 3m
aM	< 1 km <sup>2</sup>	> 3m
Am	> 1 km <sup>2</sup>	< 3m
am	< 1 km <sup>2</sup>	< 3m

# Matrixcalculation

## **Summary aggregates (sand, gravel, hardrock) demand-driven safeguarding**

[www.bmwf.at](http://www.bmwf.at)

**Assuming that the identified areas are safeguarded by means of land use management, a demand coverage for aggregates in the periods regarded can be ensured.**

Sand, gravel, hard rocks: The demand can be provided, in compliance with transport distances <30 km for at least 50y /100y from a conflict-free surfaces with complete respect for the environment and groundwater protection.

Claiming conflicting areas (e.g. Natura 2000 areas) for securing long term supply with aggregates is not required.

- ▶ soft and hard rocks could be safeguarded in a demand driven approach in a balanced amount.

- ▶ Work of BMWFW in 2010 "completed"
- ▶ Results were submitted to the planning authorities of the regions for further implementation
- ▶ Implementation accompanied by expertise of BMWFW
- ▶ periodic update is necessary due to developments in land use planning, legal affairs or reserve development (eg water management, nature prot. & conservation; mining information system for reserve monitoring.....)
- ▶ AMP as an impetus for a rethinking of spatial planning relevant expulsions on the basis of water management act (re-dimensioning of protection and conservation areas)

- ▶ AMP as an impetus for a research project on the impact of dredging on the quality of surface and ground waters and other R & D projects
- ▶ AMP as a "best practice model" for minerals planning in the Raw Material Initiative of European Commission
- ▶ Implementation of AMP results in regulatory instruments of land use planning in Vorarlberg, Tirol, Burgenland
- ▶ Ongoing coordination with regions concerning implementation of AMP results in regional development programs

- ▶ inconsistent position of industry and regions concerning implementation
- ▶ No implementation in some regions, e.g. Upper Austria
- ▶ AMP is currently a legally non-binding planning instrument
- ▶ currently “minerals planning” (AMP) is checked by Austrian Court of Auditors (BMWFW, Tyrol, Upper Austria, Lower Austria)

## Securing Raw Material Supply:

- ▶ multidimensional matter (3-D land use management, variations in supply and demand with time and region, technological developments, variations in required minerals /commodities)
- ▶ Protection of deposits by means of minerals economics (optimal and complete extraction of deposits, supply/demand)
- ▶ Protection of deposits by means of spatial planning (securing access to deposits)
- ▶ Economical and efficient use of raw materials (resource efficiency)
- ▶ Multifunctional use of land

## **Securing Raw Material Supply:**

- ▶ methodology is appropriate but extensive
- ▶ results could be applied „everlasting“ (improvements by progress of science)
- ▶ political consensus for transposition of minerals safeguarding at an early stage is the prerequisite for success (municipal, regional and federal level)
- ▶ conviction of raw materials industry is prerequisite for political consensus

# Securing raw materials supply = securing the future
