ULISSES

Low-power Sensor Systems
for networked Multichannel
Gas Sensing

Stephan Schröder
stephan.schroder@senseair.com

Key Facts

- Horizon 2020 funded & started in 2018
- 2 universities & 2 research Institutes + 4 companies
- Optical NDIR gas sensing approach for multiple gases
- Website: <https://www.ulisses-project.eu/>
- Three main challenges addressed:
 - IR light generation
 - Light-gas interaction
 - IR light detection

Motivation for CO₂ measurements

- Poor air quality is affecting negatively our health, well being and productivity
- CO₂ is an indicator for air quality
- Smart on demand HVAC reduces energy consumption
- CO₂ is a greenhouse gas and emissions need to be reduced

Our Starting Situation:

Classical free-space optical (NDIR) gas sensors

- + Specific
- + Fast
- + Low drift
- + No hysteresis
- Bulky
- Power-hungry
- Expensive

Our Vision: A highly miniaturized Gas Sensor for Air Quality Mapping

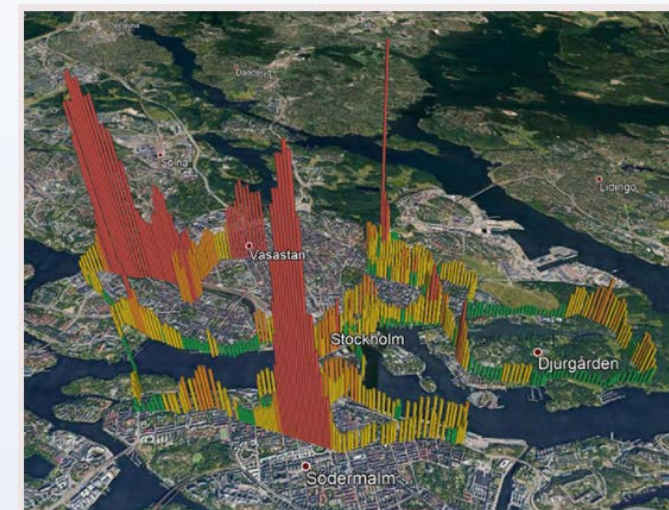

Schematic illustration of the integrated multi-channel gas sensor.

Envisioned smart gas sensor integrated in a wearable gadget.

Miniaturized → power-efficient
 integrated → cost-efficient
 mid-IR → specific

Sensor Fusion & Self-Calibration

- Use machine learning based on data uploaded to the cloud.
- Each sensor can learn from its history and self-estimate its reliability.
- The reported measurement is not just a single ppm-value, but a self-estimated belief function with a probability distribution over a range of ppm-values.
- Geometrical methods can be used to achieve more accurate data from several sensor in the same area. This is used for calibration, and improves the self-belief!

Thank you from the **ULISSES** **AIR SENSORS FOR EVERYONE, EVERYWHERE** Consortium
