**Data-based planning of energy-efficient public transport services and infrastructure**

*M. Damerau, Rupprecht Consult, Cologne, Germany*

## Planning for sustainable Public Transport

### in LOW-CARB:

- ... for better accessibility of FUA's (e.g., new mobility services for remote business areas)

### In EfficienCE:

- ... for PT infrastructure and better energy performance

Public transport

Pilot demonstrations

SUMP

Planning for sustainable Public Transport

New mobility offers

in **LOW-CARB**:

- ... for better accessibility of FUA's (e.g., mobility services for remote business areas)

Stakeholder cooperation

Collecting, sharing, analysing data

In **EfficienCE**:

- ... for PT infrastructure and better energy performance

Governance

Planning tools

Collecting, sharing, analysing data

How to make use of data ...

... for planning of better Public Transport services and energy infrastructure?

... for better investment decisions in public transport?

## LOW-CARB: Capacity building for integrated low-carbon mobility planning in functional urban areas

### Programme Specific Objective:

To improve capacities for mobility planning in functional urban areas to lower CO<sub>2</sub> emissions

### Project Main Objective:

LOW-CARB project aims to enhance capacities for integrated low-carbon mobility planning for functional urban areas in Central Europe.

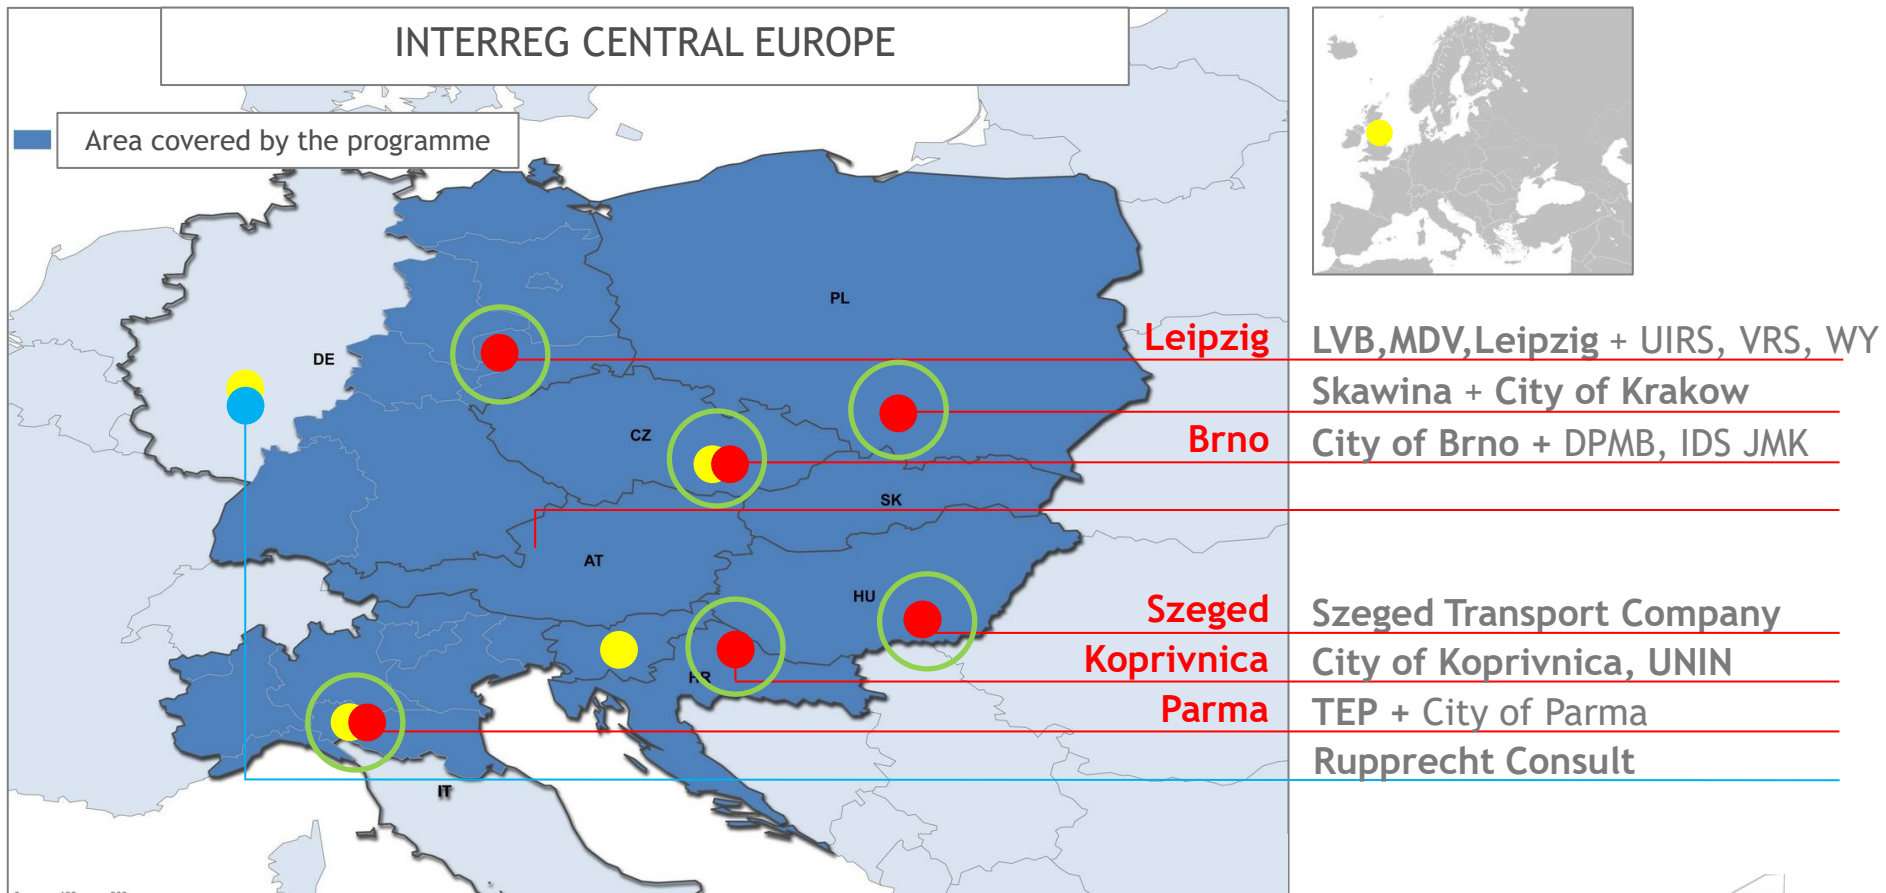

### Project Specific Objectives - with a focus on public transport:

- *Integrated low-carbon mobility planning* for functional urban areas
- *Capacity building* for integrated low-carbon mobility planning in FUAs
- *Pilot actions* for low carbon mobility in FUAs

TAKING COOPERATION FORWARD

## Sharing data for amending accessibility of remote business area

- Accessibility map
- Masterplan Leipzig Nordraum

# LOW-CARB: MOBILITY AND SERVICES IN SZEGED

Place of departure of responders living in Szeged, by district

Distribution of means of transport by the number of respondents citing them as their preferred means of travelling to work

## Developing a city-wide open data platform

- Action plan for company-based mobility management
- WIFI passenger counting system
- Application for CO2-emissions calculation

## EfficienCE: Energy Efficiency for Public Transport Infrastructure in Central Europe

### Programme Specific Objective:

To develop and implement solutions for increasing energy efficiency and renewable energy usage in public infrastructures

### Project Main Objective:

EfficienCE aims at reducing CO2 emissions and integrating RES in the PT sector in CE by reducing energy consumption in PT infrastructure.

### Project Specific Objectives - with a focus on public transport:

- *Strategies and managerial approaches for improving energy efficiency in Public Transport infrastructures*
- *Capacity building, evaluation and development of toolkits*
- *Pilots for testing and implementing novel energy saving and RES-integration technologies*

# INTERREG CE PROJECT EFFICIENCY: WORK PACKAGE STRUCTURE

## EfficienCE

- 5 action plans on data-based PT planning & financing
  - City Leipzig & LVB: application of urban data platform for e-mobility station planning
  - BKK: prepare investment decision (trolley or e-buses)
  - PMDP, Gdansk university of Technology: buffer storage in PT infrastructure for in-motion charging concepts
  - ...

## Municipality of Maribor: Action plan for multipurpose PT infrastructure use for fast-charging e-buses

Mitja Klemenčič, Marijan Španer, Matej Moharič (University of Maribor): Data needed for planning of fast-charging infrastructure

Data Category	Indicator	Data needed	Method and data availability
Spatial planning / infrastructure	Number of exposed inhabitants to negative effects of buses along the PT route (noise, emissions) Priority of bus lanes for electrification	Number of inhabitants living 100 m along the bus route Number of bus cycles per route sectors per day.	GIS Model (UM) GIS data - Maribor Data center Timetable - Marprom
	Number of locations of the charging facilities for possible multipurpose use	Existed and charging plans for all modes (e-cars, e-car sharing, Park and ride, e-bike sharing, Railways, e-bus)	GIS model
Energy (PT)	Energy consumption of an e-bus on selected bus route (kWh/km) Power of e-bus charger (kW)	Driving cycle per bus per route, (speed, acceleration, dwell time, route elevation) Daily timetable of all buses on route Temperature Passenger load Bus characteristics (battery capacity, weight, resistance, traction power, recuperation ratio, auxiliary traction)	Matlab model (UM) Driving real life cycle data - tachographs, Timetable, Bus characteristics, Passenger load - (Marprom) Temperature (ARSO)
	PT vehicles in the future	Passenger demand - OD Matrix Headway per route Load factor PT network	Transport model, Marprom
Economy	TCO - €/pkm LCC LCOC	Worst case scenario energy consumption of e-bus (kWh/km), cost for investments in vehicle, infrastructure, battery, cost for operation (energy), passenger load, km per day, external costs	Excel model (UM) Marprom, Best practices

# INFRASTRUCTURE PLANNING IN EFFICIENCY

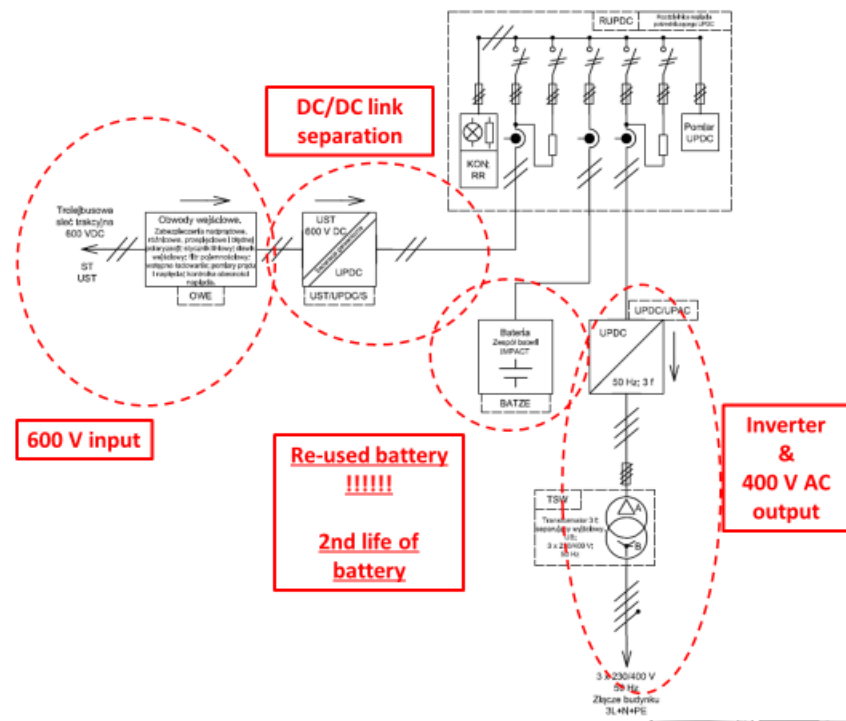

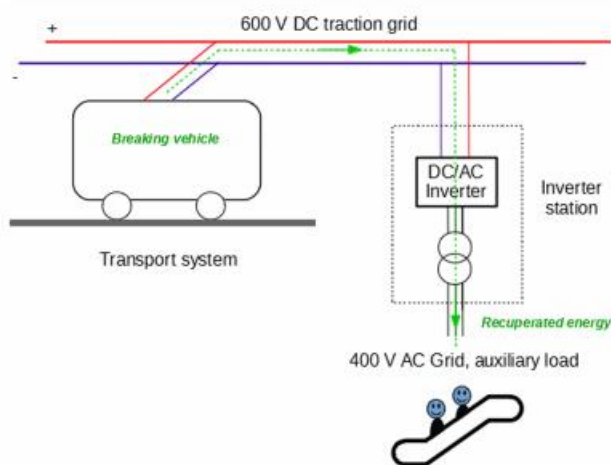

Municipality of Bergamo, Redmint: Action plan for the integration of RES into charging infrastructure

## Pilot action by PKT Gdynia and GUT Gdansk: recuperation of breaking energy

EfficienCE: Mini inverter station (PKT)

PRIORITY: LOW CARBON CITIES AND REGIONS

TAKING COOPERATION FORWARD

# INFRASTRUCTURE PLANNING IN EFFICIENCY

## Pilot buffer storage station by PMDP for in-motion charging concepts: Analysis of tachograph data by Gdansk University of Technology

„We have started to aggregate the data and got preliminary results. For this moment, we feed our database with the data generated from the source files.“

The screenshot shows an Excel spreadsheet with a complex data table. The table has multiple columns representing different electrical parameters and rows representing various components or measurements. The data is organized into sections, with some rows highlighted in blue and others in white. The spreadsheet appears to be a technical analysis tool used for infrastructure planning.

„When we finish this, we can run the program and check if the data is adequate and, if not, correct them accordingly.“

ere

## Photovoltaic foil on top of a metro station in Vienna

- In regular operation since 14. January 2020
- At peak times, 50% of the station's electricity is already generated from solar energy!
- The PV system currently produces 14 hours of energy per day

## Exploration and discussion of ...

- Methods
- Applications
- Data
- Stakeholder cooperation ...

## ...support

- sound infrastructure and vehicle investments
- potential future use cases

## TOPIC 1:

# Data-based planning of energy-efficient public transport services and infrastructure

**EfficienCE**

**LOW-CARB**

## Hilia Boris Iglesia *UITP*

The value of data for the  
public transport sector

12/05/2020

# THE VALUE OF DATA FOR THE PUBLIC TRANSPORT SECTOR

Hilia Boris Iglesia  
Manager

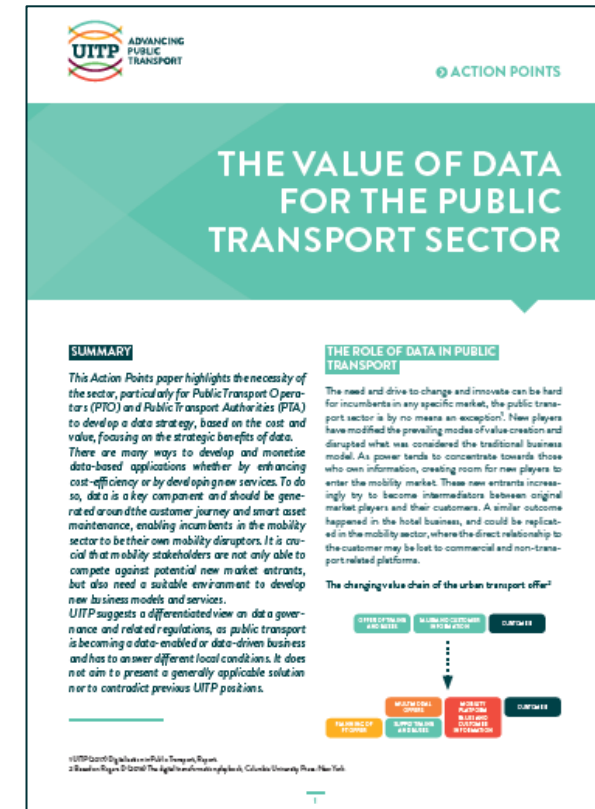

UITP – International Association of Public Transport

# ➤ KEY MESSAGE

This [UITP Action Point](#) paper highlights the necessity of the sector, particularly for Public Transport Operators (PTO) and Public Transport Authorities (PTA) to **develop a data strategy**, based on the cost and value, focusing on the strategic benefits of data.

UITP suggests a **differentiated view on data governance** and related regulations, as public transport is **becoming a data-enabled or data-driven business** and has to answer different local conditions.

It does not aim to present a generally applicable solution nor to contradict previous UITP positions.

Includes 10 recommendations

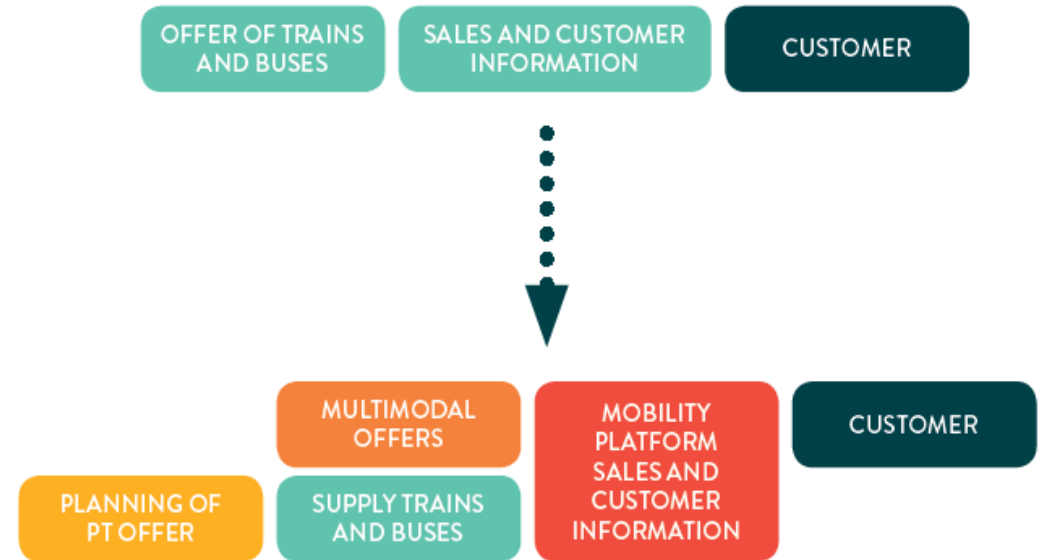

# ➤ SETTING THE TREND FOR DATA IN URBAN MOBILITY

The need and drive to change or innovate can be hard for incumbents. New entrants are increasingly seeking to intermediate between original market players and customers

Clear link of the catalytic role that PT sector plays in the development of cities and economic, showcased by a clear preference towards open data.

Mobility operators must now compete on two fronts: private car transport and digital market

Main question highlights **how to align different priorities concerning the use of data** for the mobility ecosystem and towards operators.

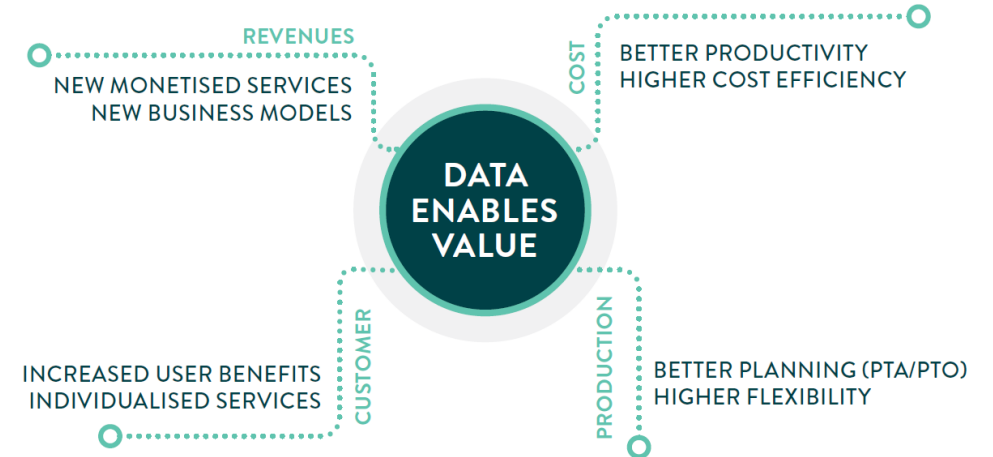

The public transport sector should be the backbone and integrator of mobility. Integrating mobility services and keeping the customer relationship is a data business

# ➤ BECOMING A DATA ENABLED COMPANY

Transport companies must evolve into **data-enabled businesses**:

- ❖ Awareness and know-how to harness value from data
- ❖ Develop data strategies and a clear vision on collecting, storing, analysing and using data
- ❖ Awareness of privacy and data stewardship, cybersecurity and faster competitors
- ❖ Understanding of the value of data and the potential risk of publishing them openly
- ❖ Recognition when data should be opened or closed, shared or sold, depending on the potential benefits
- ❖ Open up internal data silos and improve data analytics

Advanced business analytics support decision-making by **turning relevant data into valuable insights** to improve business performance

PTOs and PTAs should become a data-enabled business and have a clear strategy on data  
Platform economics strengthens the need for the digital transformation of the sector

# ➤ FIGURING DATA OUT

In its raw form, data needs to be shaped, processed and interpreted to provide added-value

The ecosystems has provided fertile grounds to thrive, due to:

- Increasing interconnectivity of people and objects
- Great levels of data created, stored and analysed
- Enabling complex analysis of data

## Different types of data in PT

Customer data	All data on the customer itself, as well as passenger preferences and their use of the system
Operational data	Data produced by operators' assets for the delivery of public transport services
Mobility data	Data which provides information of urban mobility patterns
Exogenous data	Data from third parties which can have an impact on mobility

**Data has and brings value. Customer data, operational data and the knowledge of the market are of strategic and commercial value**

**Data is as an asset and should be treated like such, one can generate revenue or save costs out of it and put it at risk**

# ➤ COST OF DATA

All activities around data incur expenses to the operator and authority, such as:

- Upfront infrastructure
- Establishment of suitable system capable to perform
- Variable costs
- Potential upgrades/expansions (including technological innovations and evolving needs)

## Key requirements:

1. Investing in networks
2. Strengthen and expand operator capabilities

**Data has a cost. The process of collection, storage, analytics, security and privacy and elimination needs permanent attention, budgeting expenses and investments.**

# ➤ CAPTURING THE VALUE OF DATA

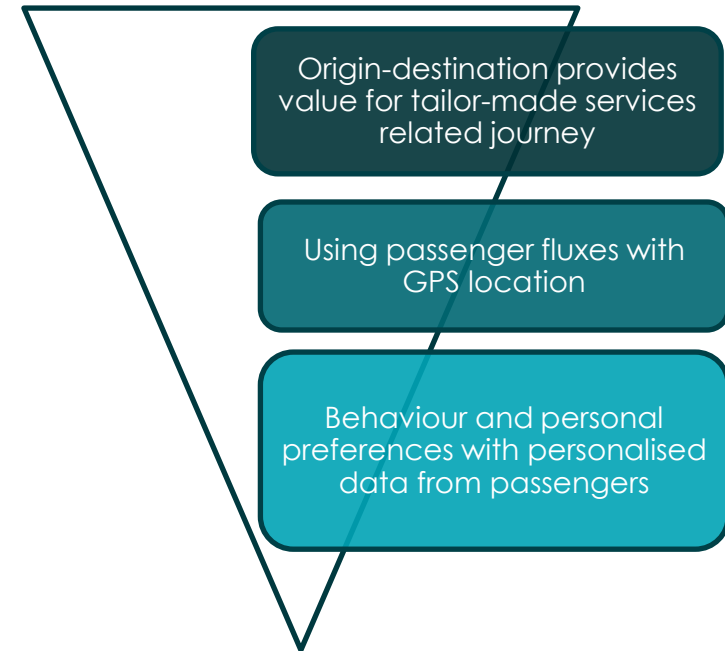

Broad range of types of data with varying degrees of granularity and potential commercial value

Awareness of how to quantify the value of data, can be done by:

- Importance in the balance-sheet
- Ability to compete
- Lifetime customer value
- Operational capabilities

Inability to do so or forecast evolution, may impact/undervalue the need to invest and financial provisions in the annual budget

Different regulatory regimes exist on the appropriate or acceptable use of data, protecting privacy rights and data breaches.

**PTOs and PTAs are collecting a lot of data especially as issuer of apps, they can use it and control it within their privacy and contractual constraints.**

# DIFFERENTIATED USES OF DATA

A general tendency can be observed in the opening of information and datasets for urban mobility activities.

The use and boundaries of data for PTOs and PTAs must weight benefits and losses with relation to all stakeholders.

## Key criteria for **data framework**:

- The importance of a fair and level-playing field
- The cost of producing and disseminating data
- The imperious necessity to preserve proprietary and commercial data

### General interest of different stakeholders in public transport

Customers	Benefit from a rich and complete network of mobility options with an easy interface
Transport Operators	Provide mobility service in the most cost-effective and efficient way
Information/Platform providers	Provide resources and expertise in the management of data
Infrastructure owners/Operators	Provision of car/vehicles sales and maintain control of data (including automotive and vehicle owners)
Transport Authorities	Creation of a suitable and economic sustainable mobility network
Governments	Benefit from opened data to foster economic development with the development of apps from third parties

# ➤ CREATING A DATA-SHARING STRATEGY

PTOs and PTAs should define locally a **data-sharing strategy** based on reciprocity and partnership

PTOs should be allowed to define:

1. Which types of data is a strategic asset in the relationship to the customer, for the market and for efficient production
2. Which types of data is costly to produce, store, maintain or is of high commercial value for the other parties
3. Which types of data could improve customer experience or create efficiency gains

PTOs are enterprises in a competitive market, this should be reflected in its relevant data legislation  
The public transport sector can and shall share data for innovation and good customer service within itself

# POTENTIAL GOVERNANCE OUTCOMES

Local clarification on the concept of free vs open data

Each dataset must be categorised and each stakeholder must be identified

The price of data can later be discussed based on either identified value or production cost

POSSIBLE CORPORATE GOVERNANCE OF DATA WITH RESPECT OF THE VALUE OF DATA			
CATEGORY OF DATA \ DATA USERS	STRATEGIC PARTNERS	COMMERCIAL VENTURES	PUBLIC INTEREST OR NON-PROFIT ORGANISATIONS
PRIVATE DATA	(If within strategy) Reciprocally exchanged under privacy restraints	(If within strategy) Reciprocally exchanged under privacy restraints	Not openable
STRATEGIC DATA	(If within strategy) Reciprocally shared	(If within strategy) Reciprocally exchanged	Not openable
COMMERCIAL DATA	Reciprocally shared, exchanged or sold	Reciprocally exchanged or sold	Not openable for commercial use
OPENABLE DATA	Shared	Shared	Open

**Data is becoming more and more regulated. The regulation has to be differentiated by the type of data and by the strategic value of the data to the public transport sector.**

# RECOMMENDATIONS

- Data has and brings value. Customer data, operational data and the knowledge of the market are of strategic and commercial value.
- Data is as an asset and should be treated like such, one can generate revenue or save costs out of it and put it at risk.
- PTOs and PTAs should become a data-enabled business and have a clear strategy on data.
- The public transport sector should be the backbone and integrator of mobility. Integrating mobility services and keeping the customer relationship is a data business.
- Platform economics strengthens the need for the digital transformation of the sector.
- Data has a cost. The process of collection, storage, analytics, security and privacy and elimination needs permanent attention, budgeting expenses and investments.
- PTOs and PTAs are collecting a lot of data especially as issuer of apps, they can use it and control it within their privacy and contractual constraints.
- PTOs are enterprises in a competitive market, this should be reflected in its relevant data legislation.
- The public transport sector can and shall share data for innovation and good customer service within itself.
- Data is becoming more and more regulated. The regulation has to be differentiated by the type of data and by the strategic value of the data to the public transport sector.

Open Data Strategy Document finalized in March 2020

Main Recommendations:

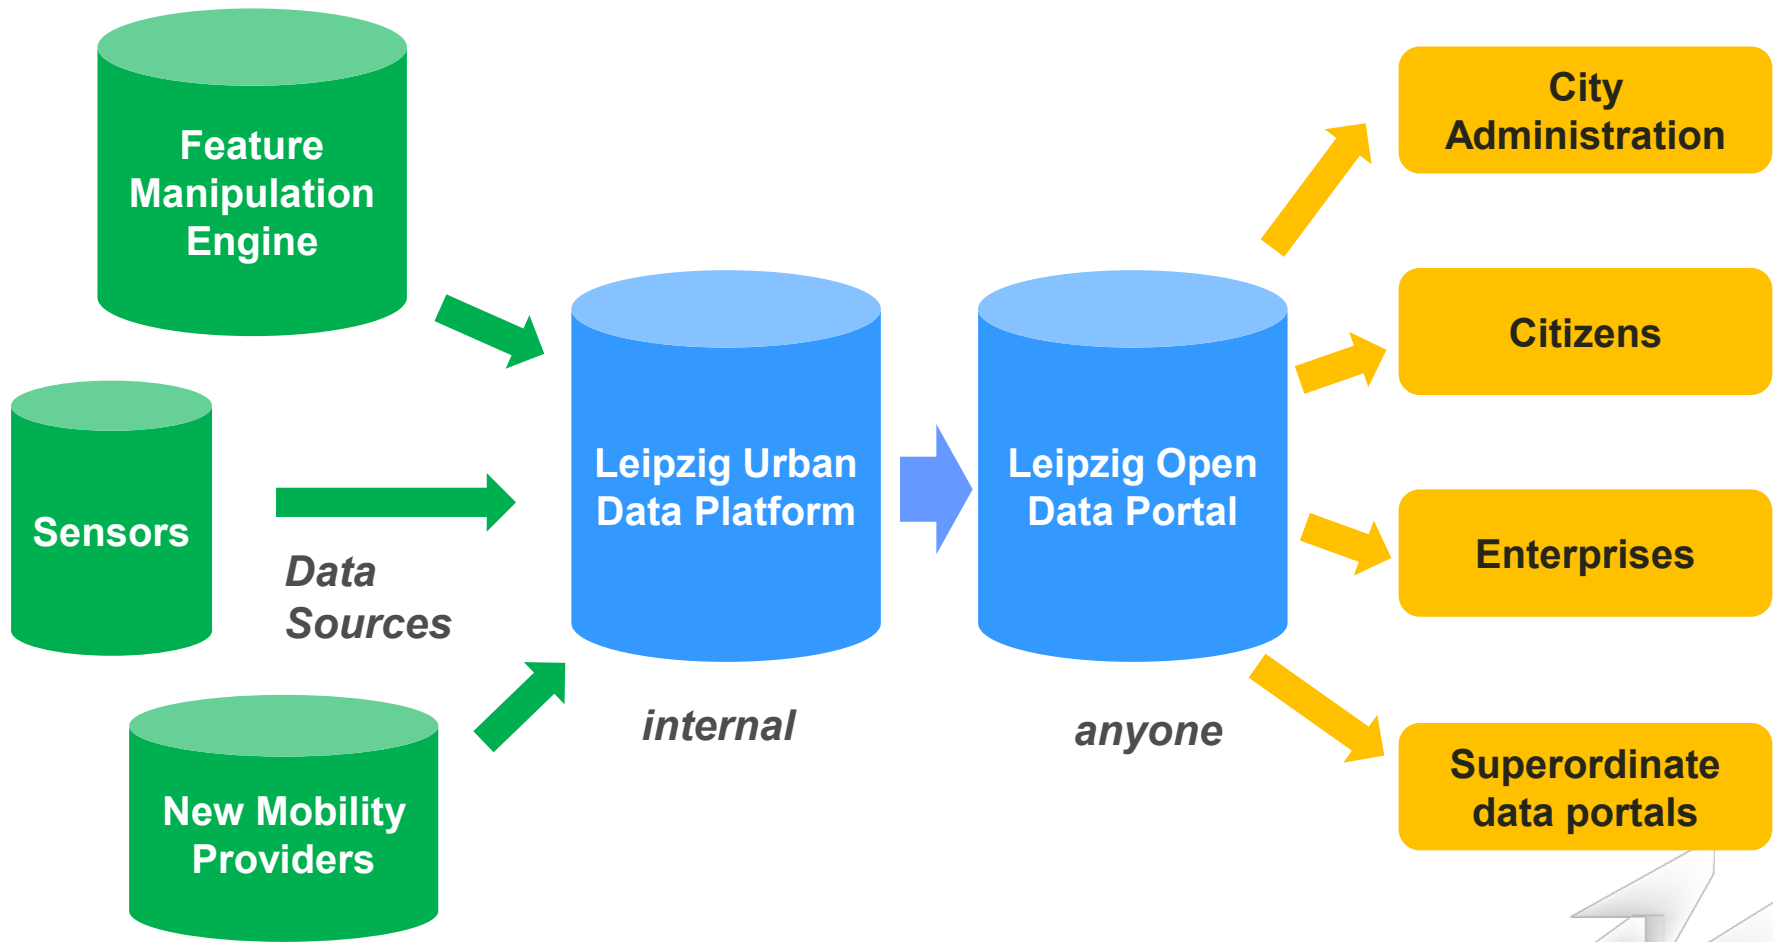

- „Open by default“: Leipzig will publish all data, documents and data services free of charge and machine readable - unless confidentiality required
- Establishing „Mobility data as a service“ (starting by opening data from traffic count systems)
- Establishing an „open data culture“ and „culture of experiments“ by providing creative space for citizen science
- Follow an iterative path to these goals.

The “Leipzig Open Data Strategy” and the integrated urban data platform with application to a specific public transport development use case

# Added value of Urban Data Platform (UDP) Leipzig

# Added value of Urban Data Platform (UDP) Leipzig

## a) Smart city management

- Use, maintenance, further development of city-relevant resources, infrastructures, processes
- Development of comprehensive processes (companies, public administration, science, research, urban society)
- Support as an information, planning and control instrument (administration, economy, citizens)
- Effective management and analytics; i.e. user-centered dashboards for policy making and decision support, strategic goal review

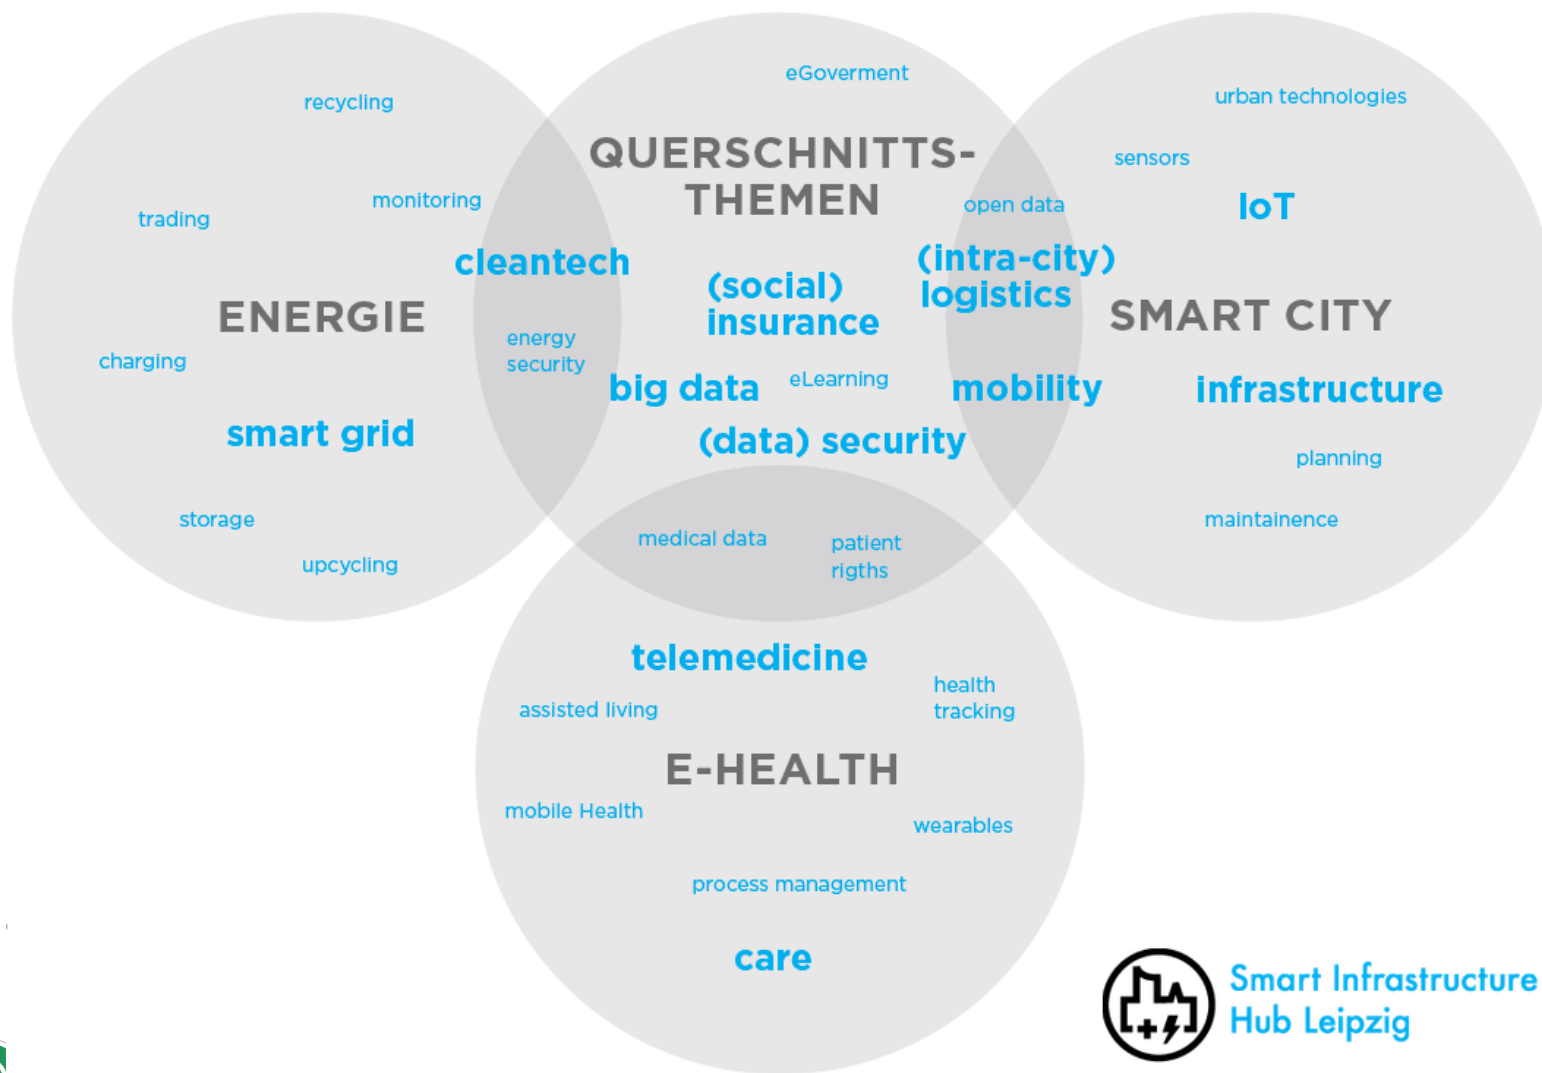

## b) Data-based innovation

- Easily accessible and connectable offer of urban data
- Access for business, public administration, science and research institutions, urban society
- Basis for urban applications
- Basis for data-based business model

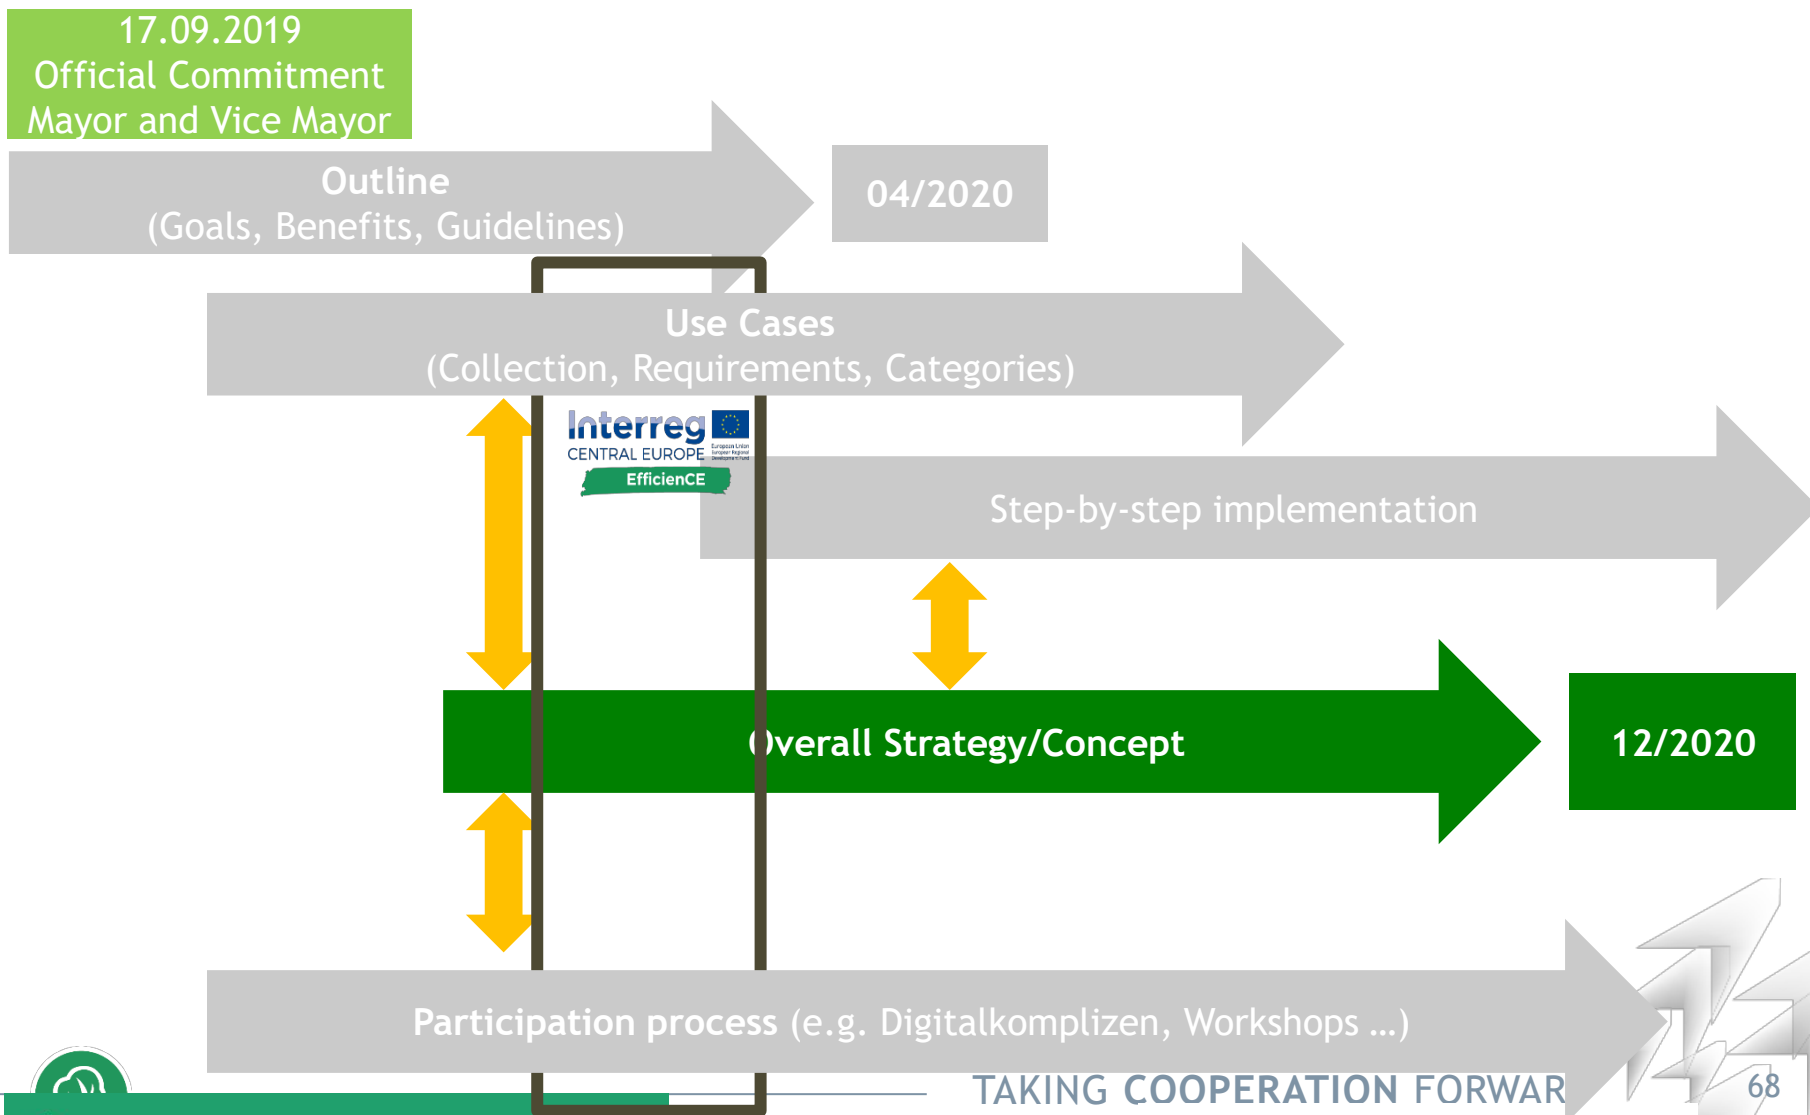

## c) Citizen engagement, participation and integration of city crowd data

# Added value of Urban Data Platform (UDP) Leipzig

# Development of Urban Data Platform - Schedule

# Use Case - Data based planning of public transport stops

- Optimization of the planning process for stops and the surrounding area
- Linkage to other types of traffic, mobility stations, mobile points including the integration of charging infrastructure, connection of new mobility services
- Consolidation of planning data between City and Leipziger Verkehrsbetriebe
- Raise attractiveness of public transport and support transformation process from public transport to mobility service provider

# LEIPZIG PARTNERS

## Stadt Leipzig

### Digital City Unit

- Lead Partner, overall Project Management
- Management of local working process

### Office for Geoinformation and Land Management

- Concept of Urban Data Platform and implementation

### Leipziger Verkehrsbetriebe

- Development of use cases for public transport infrastructure planning with the help of Urban Data Platform
- Development of curriculum for energy managers

**Data-based mobility and  
PT planning in Szeged**

TAKING  
**COOPERATION**  
FORWARD

 Low-Carb and EfficienCE Transnational Workshop - 13 May 2020 Webinar

 **Data-based mobility and PT planning in Szeged**

 dr. Zoltán Ádám Németh - Szeged Transport Company - chief of public transport and railway safety

## SZKT data sources

### Public transport

- Timetable
- Planned timetable compliance
- **Passenger counting**
- Vehicle telemetry data
- Ticket validation
- Ticket and passes sale

### Parking

- Ticket and passes sale

## Wi-Fi based passenger counting system

- In relation with Low-Carb project
- Counting based on MAC ID
- Ensure a wide range of options for improved planning, optimisation and evaluation of the entire traffic network.

### Other counting options:

- Manual passenger counting: not generalizable, shows only the current situation
- Check in - check out system: expensive infrastructure
- Cameras: resource requirements, GDPR

## Wi-Fi based passenger counting system

- Wi-Fi device appearance data validated by axle load dataset

- Launched by Low-Carb project
- Supplies researchers by valuable data →  
Pilot equipment installed during the period of manual counting  
→  
Development of algorithm →  
Research report completed →  
Software development →  
Final test on 15 vehicles →  
Now the equipment is able to correctly record data

# DATA-BASED PUBLIC TRANSPORT PLANNING

# DATA-BASED PUBLIC TRANSPORT PLANNING

## Cameras:

- On vehicle, at stop - passenger counting
- On the bridge - traffic counting
- Connection with SASMob project

Wi-Fi + cameras + axle load data → generate accurate passenger data

## Szeged Open Data Platform (OVAK)

Database with municipal companies data:

- SZETÁV - long-distance heating data
- Vízmű - water consumption data
- University - air pollution sensor data
- SZKT - public transport and parking data

Goals:

- Research
- Urban development - city level intervention
- Useful in special situations - eg. road or bridge closures

Thank you for your attention!
