

Completed SEAPs' sections of public buildings – Croatia, Osijek

Deliverable D3.8.1

Work Package: WP3-Testing

Activity A3.8: IMPULSE-system trial applications for SEAPs' development

Integrated Management Support for Energy efficiency in Mediterranean PUblic buildings/ IMPULSE

Project ref.: 1MED15_2.1_M2_178

Priority Axis 2: Fostering low-carbon strategies and energy efficiency in specific MED

territories: cities, islands and remote areas

Objective 2.1: To raise capacity for better management of energy in public buildings at

transnational level

Status: Final

Executive summary

The purpose of this activity is to further test the applicability of the system for the preparation of SEAP's sections of public buildings. APPs will undertake the trial applications and complete the relevant SEAPs sections accompanied with full reports of gradual renovation plans, monitoring plans and financial opportunities to implement planned projects in the future, with evident accomplishment of the ultimate goal of at least 20% energy savings of their public-building stock by 2020 (as prescribed by CoM objectives).

Keywords	Public buildings; City of Osijek SEAP; IMPULSE trial applications.

1. Introduction

The purpose of this activity is to further test the applicability of the system for the preparation of SEAP's sections of public buildings. APPs will undertake the trial applications and complete the relevant SEAPs sections accompanied with full reports of gradual renovation plans, monitoring plans and financial opportunities to implement planned projects in the future, with evident accomplishment of the ultimate goal of at least 20% energy savings of their public-building stock by 2020 (as prescribed by CoM objectives).

2. SEAP trial applications' methodology and assumptions

The evaluation criteria and assumptions for the City of Osijek were defined by the deliverable D3.5.1 which shows the Gradual Renovation Plan and the financial plans for the City of Osijek that was automatically created from the implementation of the Plug in tool developed by EIHP, which was based on D.3.4.1: Simulated results and hierarchy of retrofitting measures, KPIs processing tool.

The following criteria has been chosen with the corresponding weight for the pilot city Osijek:

	Weight	
	factor	Measures
54. Total investment cost per total annual energy saved -	30	HRK/(kWh of energy
National Currency/(kWh of energy saved)	30	saved)
16. Annual total energy-related operational cost - National	20	
Currency/yr	20	HRK/yr
24. Total annual primary energy savings - kWh/yr	10	kWh/yr
28. Annual electricity savings - %	30	%
37. Total annual avoided CO2 emissions - %	10	%

Typology number 10 is prioritized because it represents educational buildings – kindergartens, as well as the Deep retrofits and usage of renewable energy sources:

	Option	Penalization (± 30%)
Building Typology	PBT10	30%
Type of Retrofit	Deep retrofit	30%
RES	RES	30%

According to priorities, typologies 1, 3 and 5 have been eliminated (buildings under protection as cultural heritage, sport halls and offices), but all types of retrofits were considered, from minor to deep:

	Minor retrofit	Medium retrofit	Major retrofit	Deep retrofit

3. SECAP results for the City of Osijek priority municipal buildings

Above-indicated table represents City of Osijek assumptions for the development of SECAP, where the stated criteria with the dynamics of 3% annual surface retrofit will achieve the following results¹:

Relative retrofit area ann	ualy	3%	%			
Total floor area		114.267	m ²

The baseline for the energy consumption calculated from the Deliverable D3.4.1 is 19.214.888,91 kWh and the percentage of the savings is calculated in relations to the stated value.

The most important KPIs selected for the renovation plans are related to each family of indicators from the project: energy, environmental and cost:

Total investment cost per total annual energy saved (HRK/kWh of energy saved) – selected as the most important KPI and has been ranged with the highest weight factor due to the willingness for achieving high energy-savings with least-cost. The weight given for this criterion is the most important: 30%

Annual electricity savings (%) – due to public buildings which mostly have old lighting systems that cause significant costs regarding annual electricity consumption, this criterion is also given 30%

Annual total energy-related operation cost (HRK/yr) – criterion important for public bodies that have significant expenses in operation costs for their public buildings. Due to technical features of public buildings which mainly refer to old heating systems, those buildings have high energy-related operational costs, therefore the indicators value is 20%.

Total annual primary energy savings (kWh/yr) - One of the main aims of the project is to reduce the primary energy consumption of the buildings, according to the conditions to establish the different levels of retrofit. This indicator hence is very important for the project but also is important for the public bodies, which have significant expenses in operational costs for their public buildings. Those buildings are often old and work with old heaters, are not insulated and consume a lot of energy. The weight given for this indicator is 10%.

Total annual avoided CO2 emissions (%) - As a major part of the covenant of mayors, the aim to achieve by the signatories is to establish SEAPs which involves reducing by 20% the CO2 emissions by 2020 and by 40% by 2030. This environmental criterion, particularly in the context of the past few years, is more and more important in the choice of the actions to lead for reducing our impact on our planet. The weight given for this criterion is 10%. The weight is less important because the main purpose of Mayors or elected people is still more linked to energy savings, which means money saving.

Taken all that is stated into account, the plan that perceives 3% retrofits annually, the annual savings (as visible in the picture 1) is:

2019: 711.637 kWh2020: 858.568 kWh

The total savings (sum of the two years): 1.570.205 kWh, which represents 8,17 % savings from the baseline value.

Methodology for the City of Osijek with which we achieve 20% savings by 2020. Is to simply increase the percentage of retrofit, i.e. retrofit of more surface annually, which for the City of Osijek specifically means that the retrofit percentage must increase from 3% to 6%.

Taking this into account our tool provided the following results for the City of Osijek:

2019: 1.570.206 kWh2020: 2.442.374 kWh

Total savings amount to: 4.012.580 kWh, which represent 20.88 % savings from the baseline value as visible in the table below:

Relative retrofit	area annualy	6%	%

5. Conclusion

Taking under the consideration the fact that the educational buildings such as kindergartens and schools are priority buildings for the City of Osijek and that the selected criteria are vital as we are striving towards "deep retrofit" options, the IMPULSE-system trial applications for SEAPs' development has indicated that, in order to achieve 20% savings by 2020., the City of Osijek must increase the area retrofit percentage from 3% to 6%.
