

Slurry Acidification Market Potential

Mid-term meeting, Latvia, October 2017

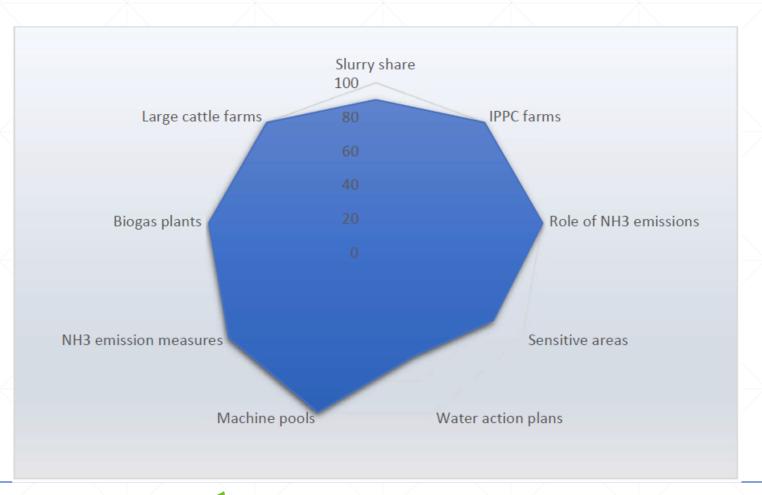

6.1 Report on Market Potential - Objective

- The overall goal of the market analysis is to
 - · provide an estimate of the potential for slurry acidification and
 - an example of the corresponding number of SAT installations
 - in each of the eight EU member states of the Baltic Sea Region as well as Russia and Belarus.

6.1 Report on Market Potential - Method

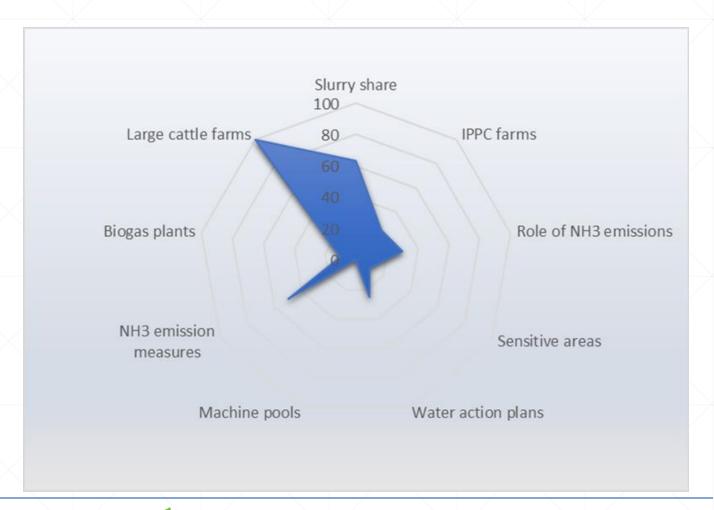

Germany is scoring high on many parameters, for instance due to its high focus on NH3 emissions in regulation of livestock farming. The total of the subjective scoring is 835 and the weighed potential for slurry acidification thus estimated to be 159.5 million tons. The production of this amount of acidified slurry would require 3,435, 1,794 and 2,655 installations, respectively for in-house, instorage and in-field slurry acidification.

6.1 Report on Market Potential - Method

- Another spider example, from Belarus, visualises the differences in national market potentials.
- It shall be kept in mind that the scoring is subjective.

result

 Today, there is a theoretical, weighed potential for SAT installations with a capacity to process 242.8 million tons slurry and other liquid manures in raw and processed form in the Baltic Sea Region.

 An example of equivalent number of SAT installations, given the same market share as for DK, is 5,215 in-house, 2,730 in-store, and 4,043 in-field installations.

| | Estimated, weighed potentia for slurry acidification | | Example of equivalent number of SAT installations, given the same market share as for DK | | | |
|---------------------|---------------------------------------------------------------|----------|------------------------------------------------------------------------------------------|----------|--|--|
| | Million tons | In-house | In-storage | In-field | | |

| Sweden | Around 25 | | | | | |
| Belarus | None, big farms have | their own mach | nine pools. | | | |
| Russian BSR regions | No, not in the same way, but all big farms have their own machine pools. | | | | | |

result

- None of the countries have direct NEC measures – they are integrated in other legislation.
- Answer from Polish side is that the Polish Government actively works against EU policies in this field!

| Country | | |
|-----------------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Denmark | | Yes/No, measures are integrated in other legislation, especially IED |
| Estonia | | No - some measures via ND regulations (Estonian Water Act, 2016) |
| Finland | | Yes/No, through feeding and manure handling legislation integrated in other legislation, f. ex IED |
| Germany | | Yes/No - New measures related to slurry spreading will be implemented under the new fertilisation ordinance (Düngeverordnung, DüV) |
| Latvia | | Yes/No – Cabinet Regulations No. 829 and 834, considerations ongoing |
| Lithuania | | There are no concrete measures to reduce ammonia emissions from farming, but several measures are integrated in the entire regulation of farming. |
| Poland | | No, and Polish Government is actively working against the reach of the decided target. |
| Sweden | | No: but commitments based on Gothenburg Protocol and objective of no eutrophication |
| Belarus | | None, but ammonia emissions are considered as part of the entire set of regulations for farming. |
| Russian BSR reg | jions | n/a, but Russian Schemes of integrated use and protection of water bodies (SKIOVO), are for some rate similar to Action Plans under Water Framework Directive. |

The project makes a 360° examination of SAT's for the BSR and for the individual countries

Ammonia emissions are increasing

- Status for ammonia emissions: It is going in the wrong direction!
- Germany remain the country with the largest distance to ceiling.
