

EAAP 2018

69th Annual Meeting of the European Federation of Animal Science

Dubrovnik, Croatia, 27th to 31st August 2018

Session 26 Genetics & Genomics

Connectedness and application of breeding schemes for sheep & goats

Genomic selection on Latxa dairy sheep

Itsasne Granado-Tajada & Eva Ugarte

Breeding program of Latxa breed (1984)

- Dairy sheep breed native from Basque Country and Navarre (Spain)
- Selection based on pure breed
- Breeding goals:
 - Milk yield
 - Milk composition: fat and protein content
 - Udder morphology
- Annual genetic improvement of 3.5-4% in milk yield (Ugarte, 2017)

GENETIC EVOLUTION OF STANDARISED MILK YIELD

Lacaune (Baloche et al., 2014; Barillet et al., 2014)

- Accuracy gain of GS over parent average
 - Milk yield: 0.15
 - Other characters: 0.10-0.20
- Reduction of AI rams by 20-40 %

Lacaune: GS was implemented in 2015

Manech and Basco-Béarnaise (Legarra et al., 2014)

- Increase in accuracy in single-breed predictions
 - MTN: 0.11 MTR: 0.16 BB: 0.06
- Multiple-breed pooled predictions
 - No increase in accuracy of genomic evaluations

Manech and Basco-Béarnaise: GS was implemented in 2017

Objective

Latxa (Legarra et al., 2014)

- Hardly understandable results → No conclusive
 - Negative accuracy for CS
 - Contradictory results between breeds
- Probably due to the data structure
 - Weak relationship between training and validation group
 - Reduced number of genotyped rams

Latxa: Further studies are required

- **Ascertain the benefit of including molecular information into genetic evaluations of the Latxa sheep**

Conclusions

7.6% increase in accuracy for genomic evaluations

Lower than values reported in other breeds

- Study of the practical implementation
- Interesting genotyping strategies
